

MELD/PELD Calculator Documentation

The MELD/PELD Calculator is a utility that allows you to enter hypothetical or actual parameters and calculate a MELD or PELD score for an individual patient.

The MELD/PELD Calculator provided on this site uses the specific formulas approved by the OPTN/UNOS Board of Directors and used for the allocation of livers by the OPTN match system.

The MELD score calculation uses:

- Serum Creatinine (mg/dl) *
- Bilirubin (mg/dl)
- INR

* For candidates on dialysis, defined as having 2 or more dialysis treatments within the prior week; or candidates who have received 24 hours of CVVHD within the prior week, will have their serum creatinine level automatically set to 4.0 mg/dl.

The MELD Calculator is used for candidates who are 12 years and older. After entering the laboratory values, you may calculate the score by clicking **Calculate**. The MELD score displays in the **MELD Score** field. You may also calculate a score by simply tabbing into the **MELD Score** field.

The PELD score calculation uses:

- Albumin (g/dl)
- Bilirubin (mg/dl)
- INR
- Growth failure (base on gender, height, and weight)
- Age at listing

The PELD Calculator is used for candidates who are under 12 years old. After entering the laboratory values, you may calculate the score by clicking **Calculate**. The PELD score displays in the **PELD Lab Value** field. You can also calculate a score by simply tabbing into the **PELD Lab Value** field.

MELD Formula

The MELD score is calculated using the following formula:

$$\begin{aligned} \text{MELD Score} = & 0.957 \times \text{Log}_e(\text{creatinine mg/dL}) \\ & + 0.378 \times \text{Log}_e(\text{bilirubin mg/dL}) \\ & + 1.120 \times \text{Log}_e(\text{INR}) \\ & + 0.643^1 \end{aligned}$$

Multiply the score by 10 and round to the nearest whole number.

Laboratory values less than 1.0 are set to 1.0 for the purposes of the MELD score calculation.

¹ At the July 2001 meeting of the Liver and Intestinal Organ Transplantation Committee, the Committee agree to a the 0.643 points for etiology to all patients in order to make the MELD score comparable to previously published data.

MELD/PELD Calculator Documentation

The maximum serum creatinine considered within the MELD score equation is 4.0 mg/dl (e.g. if you enter 4.3 for serum creatinine the formula will calculate $0.957 \times \text{Log}_e(4.0)$ for the serum creatinine portion of the MELD formula).

If you answer **Yes** to the question: “Had dialysis twice, or 24 hours of CVVHD, within a week prior to the Serum Creatinine test?” then the MELD score will be calculated with a serum creatinine value of 4.0 mg/dl. For example, if you enter 3.0 for serum creatinine and answer **Yes** to the dialysis question, then the formula will calculate $0.957 \times \text{Log}_e(4.0)$ for the serum creatinine portion of the MELD formula.

PELD Formula

The PELD score is calculated using the following formula:

$$\begin{aligned} \text{PELD Score} = & 0.480 \times \text{Log}_e(\text{bilirubin mg/dL}) \\ & + 1.857 \times \text{Log}_e(\text{INR}) \\ & - 0.687 \times \text{Log}_e(\text{albumin g/dL}) \\ & + 0.436 \text{ if the patient is less than 1 year old (scores for patients listed for liver} \\ & \text{transplantation before the patient's first birthday continue to include the value assigned} \\ & \text{for age (< 1 Year) until the patient reached the age of 24 months)} \\ & + 0.667 \text{ if the patient has growth failure (<-2 Standard deviation)} \end{aligned}$$

Multiply the score by 10 and round to the nearest whole number.

Laboratory values less than 1.0 are set to 1.0 for the purposes of the PELD score calculation.

The laboratory values needed to calculate the MELD and PELD scores may be entered to the hundredths decimal place (two places after the decimal, e.g., 0.01), so that coordinators can enter the value(s) exactly as reported by the laboratory. Waitlist programming will then round values to the tenths decimal place (e.g., 0.1) prior to calculating the MELD/PELD score. For example, if a center enters an INR value of 1.82, a value of 1.8 will be used for the calculation of the MELD/PELD score.

MELD/PELD Calculator Documentation

Growth failure is determined using the chart listed below. A patient has growth failure (<-2 standard deviation) if either the patient's height is less than or equal to the low height value or the patient's weight is less than or equal to the low weight value.

Male Patients Have Growth Failure (< -2 standard deviations)				Female Patients Have Growth Failure (< -2 standard deviations)
